

Swing Carriages

Swing Carriage - The most load capacity intended for forklift jibs in both the retracted or extended positions vary starting from 1935 lbs to as much as 6000 pounds. It is a good idea to ask a material handling specialist concerning the restrictions for your particular application. The load capacity rankings are meant for the jib itself and not the forklift or even the maximum load that could be carried securely making use of a certain forklift. It is important to remember that each time whatever accessories like for instance a lift truck jib are added to the lift truck, the new center of gravity made by the attachment would decrease the overall lift capability of the forklift. There are directions obtainable which provide information on how to correctly estimate these load limits.

Prior to using whatever forklift jib, be sure that the shackles and hooks are properly secured to the lift truck. Verify and even double check that the pins are tight. It is very important that the weight calculations have been properly done and double checked. Remember to take into consideration the truth that rated capacities sometimes lessen every time the boom is in an elevated position, each time the boom is extended with telehandlers or whenever the mast is tilted frontward.

Some significant tips concerning the adjustable jib are: don't ever pull a load with a lift truck jib attachment, for the reason that these [Clark parts](#) attachments are actually used for vertical lift only. Always carry the load without letting it swing. Utilize extreme caution every time a load is lifted so as to avoid tipping over the truck.
